Experiencing CBT programmes In road safety in the European Community

Project details	
Domain	Training, education and campaigns
Duration	from 01/06/2008 until 31/05/2010
Website	http://www.uv.es/proeric/index.wiki
Other sources	 State of the art report (3,4 MB)  Acceptance analysis report (3,8 MB)  Recommendations (67 KB)  Dissemination report (328 KB)  Evaluation report (499 KB)

The main objective of this project is to adapt two Computer Based Training Programmes for drivers to the Austrian, Spanish and Polish traffic and driving environment. Two CBTs have been developed by DVR (German Road safety Council) and Berufsgenossenschaften two years ago: one on fatigue and driving ("Müdigkeit") and one on driving physics ("Fahrphysik"). Both are in an early stage of implementation in the field of work accident prevention activities like seminars or workshops in Germany.

These CBTs will be translated, adapted and tested in Spain, Poland and Austria. Dissemination strategies will be developed in these countries as well as recommendations for the transfer of learning tools especially for safety in the road transport sector. The acceptance of the learning tools will be tested in specific workshops and with enquiries of the workshop participants. Together with institutions and companies which will in the future implement or use these learning tools, strategies will be elaborated to guarantee an optimal dissemination.
