## 1 Introduction

In 2020, road crashes in the Member States of the European Union claimed about 18 800 lives and left more than 0.5 million people injured. This report presents a wide range of statistical tables containing road safety data from the CARE database for the 27 EU Member States and the four EFTA countries. EFTA member Liechtenstein has limited data and is therefore only included in a small number of tables.

The report is divided into four sections. Section 1 contains this introduction and some general notes. Section 2 presents the main road safety trends in the number of crashes leading to death or injury and the absolute and relative development of the number of road fatalities. In this section, changes in the number of seriously injured are also included, but should be treated with caution as definitions vary significantly between countries. Section 3 contains detailed data on fatalities by age groups, gender and mode of transport where available. Section 4 provides an insight into time patterns and, light and weather conditions of fatal crashes.

### 1.1 The CARE Database

CARE is a Community database on road accidents (commonly referred to as “crashes”) resulting in death or injury (there are no statistics on damage-only accidents). The legal basis for CARE is the Council Decision on the creation of a Community database on road accidents (93/704/EC , OJ No L329 of 30.12.1993, pp. 63-65). The Decision obliges Member States to provide an-nual data on road accidents but does not specify the content. The variables to be collected and disseminated were subsequently discussed and agreed upon by Member States and the Commission. In this regard, a CARE expert group composed of national representatives meets 1-2 times per year to discuss issues related to the database, the variables as well as the col-lection, processing and dissemination of data. The major difference between CARE and most other existing international databases is the high level of disaggregation, i.e. CARE comprises detailed data on accidents, individuals and vehicles involved in the accident itself, as collected by the Member States. This structure allows for maximum flexibility and potential with regard to analysing the information contained in the system and opens up a whole set of new pos-sibilities in the field of accident analysis. The main purpose is to provide evidence to identify and quantify road safety problems throughout the EU roads, evaluate the efficiency of road safety measures, determine the relevance of EU actions and facilitate the exchange of experi-ence in this field. Member States officials have access to the disaggregated CARE data through a dedicated reporting tool.

National data sets are integrated into the CARE database using their original national structure and definitions, with confidential data blanked out. However, transformation rules are imple-mented in the CARE database in order to increase data compatibility and thus enhance the functioning of the system.

### 1.2 Notes

The statistical tables and figures contained in this report provide an overview of road accident data for 2010 and the last 9 years ending on 2020. For some figures, sources other than CARE have been used in order to give a more complete overview of EU road crash data.

In all tables and figures, the European Union refers to the present union of 27 countries. The data in this report result from a number of separate extractions of the CARE/Cadas-database. In case of missing years for some of the countries, the last reported year is shown in some of the tables.

Data in CARE/Cadas are not complete. Countries have their own registration systems that are not always compatible with the way data are recorded in the CARE/Cadas structure. Some countries have not provided data for certain years or are lagging behind. Reported data are sometimes incomplete, implying that some breakdowns of data are not possible or that certain categories are not visible in a breakdown. When, due to a lack of data, a breakdown table was impossible for a specific country, the country was removed from the table. A note below the table gives a list of the omitted countries. If categories are missing for a country, this is indicated in tables with a small dash, in contrast to zero cases which are shown as 0.

Missing data are a problem for the calculation of EU totals. In cases where variables were never reported for a country, the EU total is calculated without that country. In some cases, data are missing for only one or a few years. In these cases, the data are imputed to estimate the contribution of the country to the EU total. Imputed data for a single country are not shown in any of the tables or graphs.

Imputation rules are as follows:

- in case of data missing between available data for other years: linear interpolation.
- in case of missing data in previous years of the time series: copy the value of the first available year in the time series.
- in case of missing data for the last year(s) in a time series: copy the values for the last available year. The EU totals were subsequently calculated using the imputed values.

Calculation of reliable percentages, e.g. for tables 27-34, requires a minimum number of cases. Countries with less than 10 fatalities per year for a transport mode will not be shown in these tables.

Production chain:

Data extractions from the CARE/Cadas database and additional data provided by the European Commission are stored in a local SQL (Structured Query Language) database, keeping track of different versions of the data, converting variable names to concise versions. Data are combined and enriched with metadata in an ETL (Extraction, Transform, Load) scheme. Data are subsequently extracted from this local database using R (studio)<sup>1</sup>. Data transformations and imputations are all executed in the R-environment. This report is generated in R Markdown and converted to PDF-format using Knitr<sup>2</sup>. Programming code is main-tained in a project-shared GIT-repository<sup>3</sup>.

## 2 Overview

### 2.1 EU trends in the number of crashes, injuries and fatalities

## 2.2 Trends in individual countries

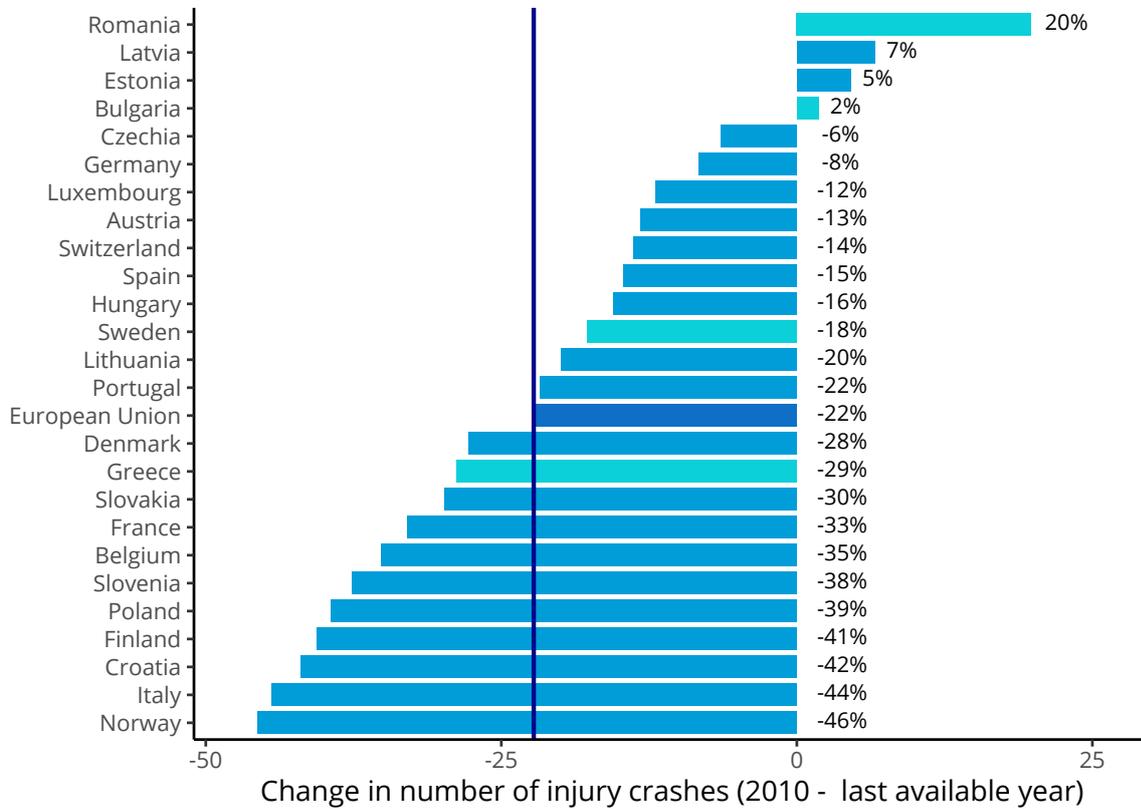

### 2.2.1 Mortality

Figure 2. Fatalities per million inhabitants in the EU, 2020 compared to 2010.

## 2.2.2 Trend in the number of crashes leading to injury or death.

Figure 3. Long-term change in the number of crashes leading to injury or death in the 27 EU countries and 3 EFTA countries (2010 : 2020\*)

Missing crash data for Ireland in one or both of these years.

The number of crashes for Cyprus, Iceland and Malta are too small to show reliable changes, the results were omitted from the graph.

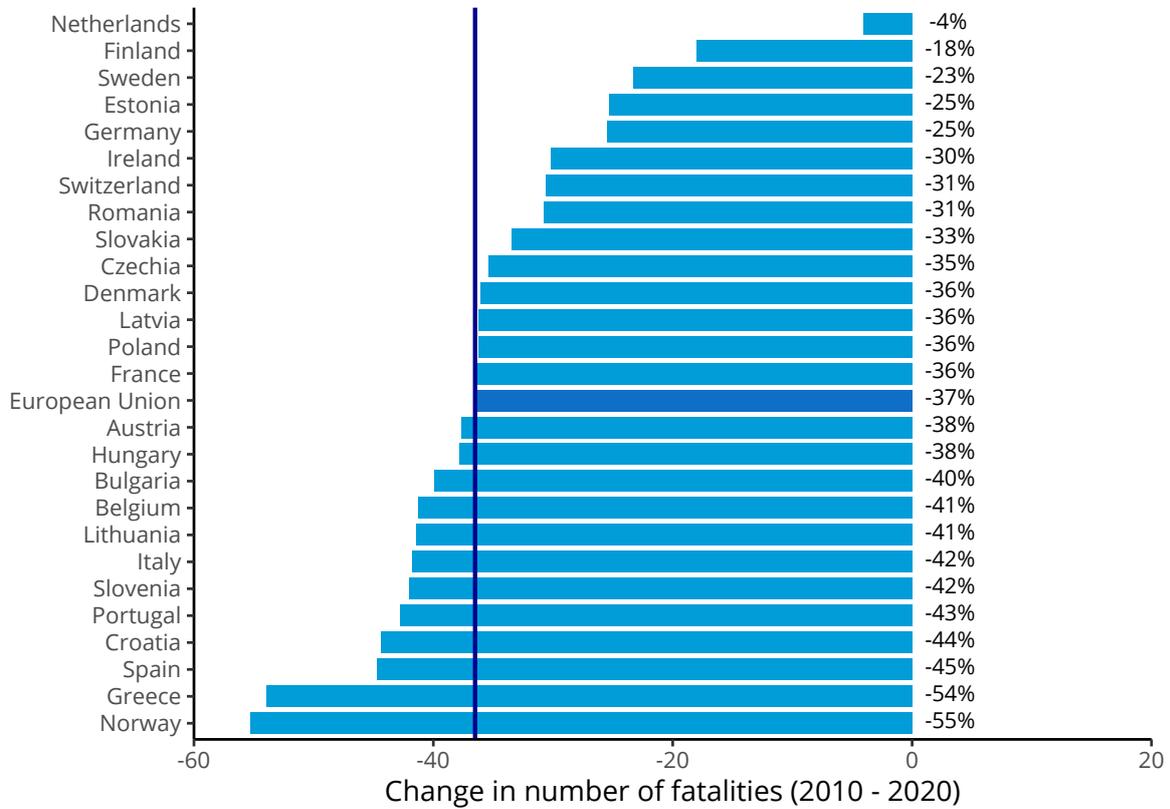

The total number of crashes in the EU for 2020 is still uncertain because it is based on data from a limited number of Member States.

The changes in the number of crashes for Netherlands ( 58%) were omitted from the graph to ensure readability.

\*For countries with missing crash data in 2020 the reduction was calculated for period 2010-2019, these countries are depicted in cyan.

### 2.2.3 Trend in the number of fatalities

Figure 4. Long-term change in the number of road fatalities in the 27 EU countries and 3 EFTA countries (2010-2020)

The change in the number of fatalities for Cyprus (-20%), Iceland (0%), Luxembourg (-19%) and Malta (-15%) were omitted because the numbers of fatalities are small and subject to annual fluctuations.

EU totals were derived by imputation.

Missing data for some countries and years are marked with a dash (-).

The total number of crashes in the EU for 2020 is still uncertain because it is based on data from a limited number of Member States.

Provisional figures for Greece 2020, Ireland 2018-2020, Finland 2020

Netherlands - The number of fatalities registered by the police is under-reported and equates to around 85-90% of the total number of fatalities published nationally by CBS-Statistics Netherlands. In 2020, the overall total was 610.

Portugal - From 2018 onwards, data includes the NUTS I regions Região Autónoma dos Açores (PT2) and Região Autónoma da Madeira (PT3).

## 7 Definitions

The CARE glossary provides short definitions for variables used in the database and in this report.

### **ACCIDENT / CRASH**

Definition: any accident involving at least one road vehicle in motion on a public road or private road to which the public has right of access, resulting in at least one injured or killed person (Source: UNECE/ITF/Eurostat Glossary).

Note: the definition of "injury" varies considerably among EU countries thus affecting the reliability of cross country comparisons.

### **CRASH AREA TYPE**

Definition: the variable indicates the crash area: "Motorway", "Urban Area" and "Rural area". Some manipulation rules are adopted to filter unknown data.

### **AGE (of person)**

Definition: the age (in years and months) of the person is filled in, derived from the date of birth.

### **BICYCLE/PEDAL CYCLE**

Definition: vehicle with at least 2 wheels, without engine. In some cases it can also use electric power.

### **BUS OR COACH**

Definitions Bus: passenger-carrying vehicle, most commonly used for public transport, having more than 16 seats for passengers. Coach: passenger-carrying vehicle, having more than 16 seats for passengers. Most commonly used for interurban movements and touristic trips.

### **CAR**

Definition: motor vehicle with 3 or 4 wheels, mainly used to transport people, seating for no more than 8 occupants. Motor vehicles with these characteristics that are used as taxis as well as motor caravans are also included.

### **CROSSROAD**

Definition: road intersection with four arms. Includes arm sections within 20m distance.

### **DRIVER**

Definition: person driving or riding any motorised vehicle or bicycle. Includes person riding an animal.

### **FATAL CRASH**

Definition: crash with at least one person killed regardless the injury severity of any other persons involved.

### **FATALITIES**

Definition: total number of persons fatally injured; correction factors applied when needed. Death within 30 days of the road crash are included. Confirmed suicides and natural deaths are not included.

### **FEMALE**

Definition: on the basis of identification documents/ personal ID number or determined by the police.

**HEAVY GOODS VEHICLE**

Definition: includes road tractor, road tractor with semi trailer, lorry over 3.5 tonnes. Motor vehicle with at least four wheels, with a permissible gross vehicle weight of over 3.5 tonnes, used only for the transport of goods. With or without a trailer. Type C driving licence required.

**HOUR OF DAY**

Definition: period of 60 minutes (24 hour notation) of the crash time.

**INJURY SEVERITY**

Definition: indicates to what extent a person (driver, passenger or pedestrian) was injured or not during a road crash. The CARE database contains data based on national definitions of 'serious injury' and is often subject to the judgement of the police records. The recommended definition is where the person required 24 hours hospitalisation. Values: Fatally injured, Seriously injured, Slightly injured, Not injured, Unknown.

**JUNCTION TYPE**

Definition: if the crash occurred at a junction, this variable indicates whether the crash occurred at an at-grade junction or at an interchange and the type of junction / interchange. Values: Not at junction, At-grade - crossroad, At-grade - roundabout, At-grade - T or staggered junction, At-grade - multiple junction, Not at grade (interchange), Other, At level crossing, Unknown, At a junction-Not specified.
